TI - Information display system for producing HTML document for WWW server
connected to internet - produces HTML document corresponding to detected
position of selected image data and displays corresponding attribute
information of image stored in produced file

NOVELTY - The position of selected image data among several displayed
data is detected, based on the corresponding co- ordinate value stored in
the produced file. HTML document corresponding to the detected position
of the image data is then produced, and the corresponding attribute
information of image stored in the produced file is displayed. DETAILED
DESCRIPTION - A file containing attribute information related to the
image, and the corresponding co- ordinate value, is produced. Based on
the image information in the produced file, image data are generated.
USE - For producing HTML document using CAD system for WWW server
connected to internet.
ADVANTAGE - Performs highlight display of target information
currently searched on the screen, when searching information and search
conditions are designated on the screen. Simplifies automatic production
and maintenance of HTML document. DESCRIPTION OF DRAWING(S) - The figure
illustrates block diagram of information display system. (Dwg.1/12)
